Re: City of Jackson, Mississippi - EPA Consent Decree
Quarterly Report No. 24

Dear Lady and Sirs:

On behalf of the City of Jackson, please find enclosed the Jackson Consent Decree Quarterly Report No. 24. Should you have any questions, please contact me.

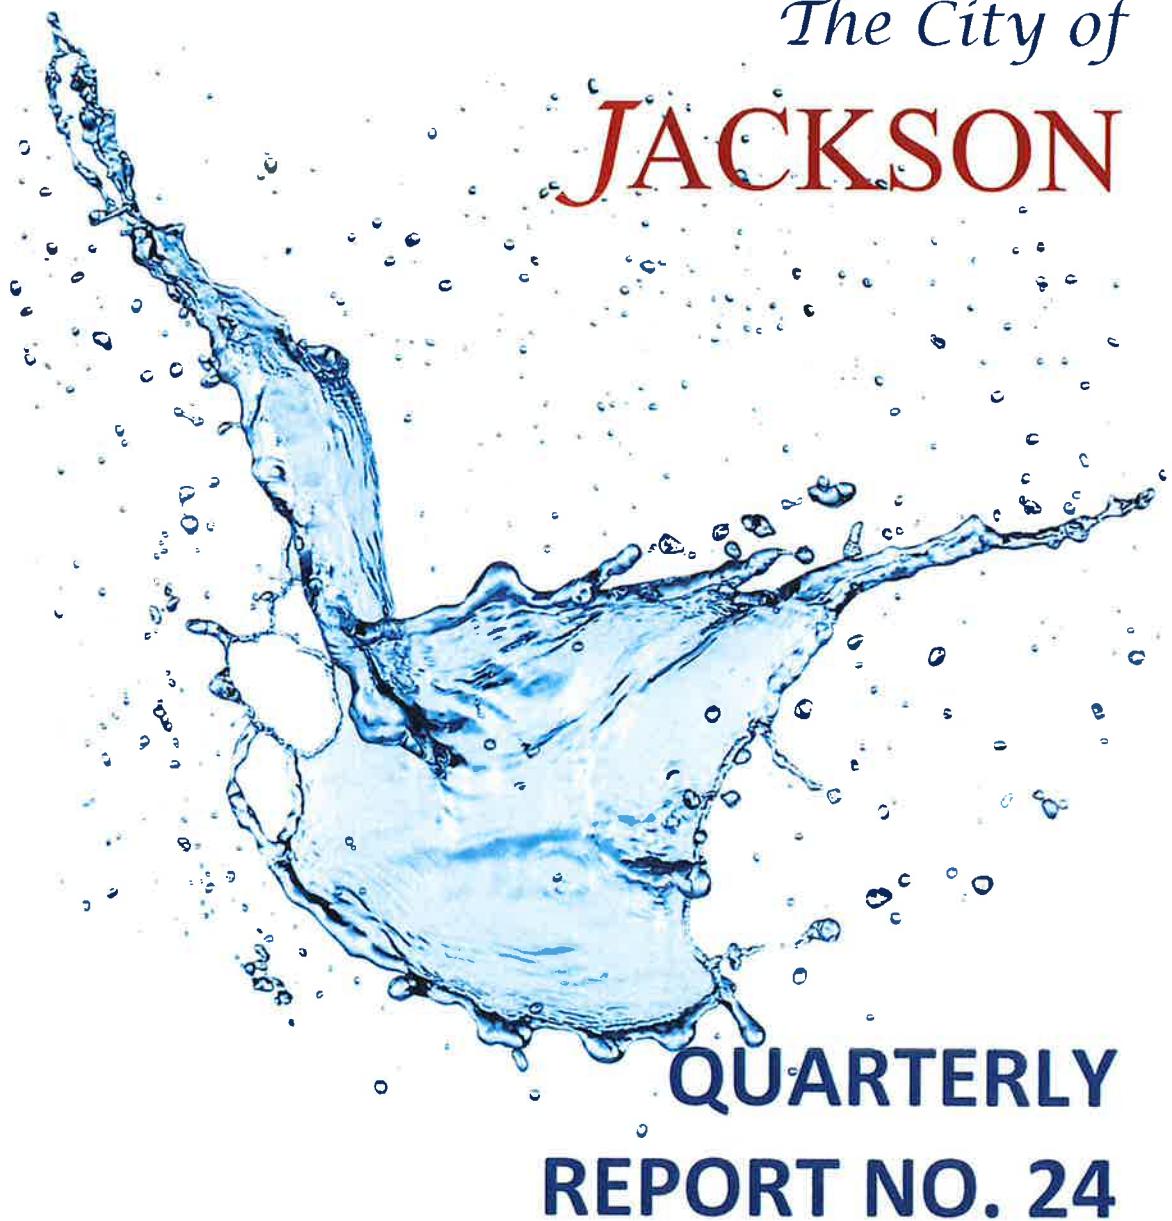

Sincerely,

A handwritten signature in blue ink that reads "David Hauser".

David Hauser, P.E.
Program Manager

Enclosure

2.4	Prohibited Bypasses	2-18

1.0 Introduction

1.1 Consent Decree Overview

On March 1, 2013, the U.S. District Court for the Southern District of Mississippi entered a Consent Decree (CD) agreed to by the City of Jackson, Mississippi (City), U.S. Environmental Protection Agency (EPA), and the Mississippi Department of Environmental Quality (MDEQ) regarding the City's wastewater collection and treatment system.

One of the ongoing requirements of the EPA Consent Decree is to submit periodic reports to demonstrate continuing compliance. The specific reporting requirements can be found in Section IX ¶ 57 of the Consent Decree. A copy of the Consent Decree, as well as previous reports, can be found on the City of Jackson website under the "Wastewater Consent Decree Public Documents" link in the Document Library.

1.2 Authority to Promulgate

Burns & McDonnell Engineering Company, Inc. was retained to assist the City in addressing the requirements of the Consent Decree under a Program Management contract. Accordingly, the Program Management team compiled this Quarterly Report from information provided by the City and its contractors to fulfill the requirements of Section IX ¶ 57 (a) set forth in the CD.

The listing and graphical summaries of the SSOs and prohibited bypasses for January 2019 – March 2019 are presented in Section 2 of this report.

2.0 Summary of SSOs and Prohibited Bypasses

SSOs are divided into three elements of the wastewater system: the collection system, pump stations, and West Bank Interceptor. Prohibited bypasses at the Savanna Street Wastewater Treatment Facility (SSWWTF), in periods when they occur, are listed in Section 2.4 of this report.

2.1 Collection System SSOs

Table 1 lists SSOs in the collection system for January through March 2019. Each day of a multiple day event is considered as a separate SSO, in accordance with the Consent Decree.

Figure 1 shows SSO events by month as a result of the following reported causes:

Grease	Roots	Solids	Collapsed Pipe	PS Failure	Excessive flow	Other
--------	-------	--------	----------------	------------	----------------	-------

Some SSO events had multiple causes. In these instances, each cause was assigned a fractional value, adding up to one (1) cause for each event.

Figure 2 shows percentages of collection system SSOs for the quarter by cause.

Figure 3 shows total volume of SSOs for each month.

Figure 4 shows total duration of SSOs for each month.

Twenty (20) events occurred at eighteen (18) locations on private property reported this period. The cause of these events was determined to be problems on the private laterals and the crews notified owners. These events have been reported to MDEQ.

Twenty (20) events occurred at cleanouts on private property this period. All events were caused by problems in the City's sewer system and are included in this report.

There were thirty (30) events for which the duration was not determined because the cause, such as collapsed pipe, has not been resolved or no SSO was ongoing but there was evidence of a previous overflow. "Previous SSO Follow up" is an SSO for which the cause, i.e. collapsed pipe, excessive flow, etc., was not resolved at the time of the first report and a crew was following up to see if an SSO was occurring until a repair could be made. Once the cause has been resolved, the total durations can be determined and reported. Volumes reported for these events are determined from periodic follow up inspections until the cause has been resolved.

There were thirty-five (35) events for which a collapsed pipe was a contributing factor to the event and of these, fifteen (15) remain unresolved. There was one (1) SSOs for which the cause has remained undetermined and will be further investigated.

2.2 Pump Station SSOs

Table 2 lists pump station SSOs for January through March 2019

Figure 5 shows pump station SSO events by month by reported cause, as listed in Table 2, as well as monthly rainfall.

Figure 6 shows percentage of SSOs by cause for the quarter.

Figure 7 shows total volume of pump station SSOs for each month, as well as monthly rainfall.

Figure 8 shows total duration of pump station SSOs for each month, as well as rainfall.

There was one (1) SSO event this reporting period. It was located at LS-26 Greenwing Court. It was caused by a bad float switch and water damage to the CNS uplink box. These issues have been repaired.

2.3 West Bank Interceptor SSOs

West Bank Interceptor SSOs at the Jefferson St location are generally caused when flow to the Savanna WWTP exceeds the facility's pumping capacity. This creates the need to restrict influent flow to the facility in order to protect the facility from flooding and catastrophic damage. Insufficient pumping capacity can be caused by equipment failures at the facility, excessive flow caused by rain events, high river levels or a combination of all the above.

Table 3 lists pump station SSOs for January through March 2018.

Figure 9 shows West Bank Interceptor SSO events by month by reported cause, as listed in Table 2, as well as monthly rainfall.

Figure 10 shows percentage of West Bank Interceptor SSOs by cause for the quarter.

Figure 11 shows total volume of West Bank Interceptor SSOs for each month, as well as monthly rainfall.

Figure 12 shows total duration of West Bank Interceptor SSOs for each month, as well as rainfall.

There were four (4) SSO events on the West Bank Interceptor this reporting period. All events were caused by equipment failure of the 100 million gallon per day Influent Pump #4, failure of temporary pump(s) and excessive flow due to rainfall and high river levels.

2.4 Prohibited Bypasses

This quarterly report does not include a graphical representation of the number of bypasses for each cause, since most bypasses at the Savanna Street WWTP are caused by excessive flow or specific causes explained below.

Table 4 lists prohibited bypasses at the wastewater treatment plant for the quarter. Unlike SSOs, each event is considered as one bypass from the day it begins to the day it ends. The event is reported in the month the bypass ends.

Figure 13 shows total volume of prohibited bypasses for each month plotted logarithmically, along with monthly rainfall.

Figure 14 shows volume and river stages.

Figures 15 and 16 plot total duration for the month, first compared to rainfall and then compared to river stages. River stages are shown as monthly average daily maximum river stage and as the monthly maximum day river stage. These appear to indicate the inflow into the system and subsequent excessive flows to the treatment facility is influenced by the river stage more than the local rainfall events. Note that duration of prohibited bypasses is plotted in days.

December 9, 2018 Event - The level in Storm Diversion Cell #3 was below 4.0 feet before December 8th rain event in which we received 2.32 inches of rain and the river stage went from 9.0 ft. to 18.7 ft. on December 09, 2018. The operators started the 13 temporary rental pumps to begin diverting the flow to the Storm Diversion Cells on December 8th and the bypass subsequently began at 10:26 a.m. on December 09, 2018.

There was a total of 15.61 inches of rain during the reporting period which is 5.69% above normal and total flow at the Savanna WWTP was 5,913.8 million gallons which is 11.0% higher than the same period last year. The total volume bypassed through March 31, 2018 for this event is 2,471.40 million gallons. Bypassing from the Storm Diversion Cells was ongoing at the end of the reporting period and is expected to continue until weather and operational issues are resolved.

All bypassed volume is chlorinated, de-chlorinated and required samples taken prior to blending with the mechanical plant effluent and subsequently discharged to the Pearl River.

Table 4
City of Jackson, Mississippi
Quarterly Report No. 24 – January 2019 through March 2019
Prohibited Bypasses

Date Began	Time Began	Location	Source	Estimated Duration, Days	Estimated Volume, Million Gallons	Reached Waterway	Receiving Water	Rainfall, Inches	Reported Cause
12/09/18	10:26 AM	3810 I 55 S	WWTP	Ongoing	2,471.40	YES	Pearl	2.32	Excessive flow. Rainfall total for the month of December was 8.03" with a total of 7.92" from December 7 – December 31.

The December 9, 2018 event is on-going through the end of the quarterly reporting period. The volume shown for this event is the total through March 31, 2019. The duration of this event through March 31, 2019 is 113 days.
